

Written Review: Small Shop Helper Program

What worked well:

The menu system was reliable and made the program easy to use. Reading product data from a CSV file allows prices and product details to be stored externally and updated easily via the spreadsheet meaning the client will not have to touch any code. The discount logic also worked and applied automatically when the subtotal reached a certain amount. The invoice formatting also worked well and made the final output clear and readable.

What could be improved:

The program could be improved by using functions to improve readability. Also it would be possible to have an end transaction and quit option so that the user won't have to rerun the program with each transaction. Currently, the program only runs in the terminal, which may not be suitable for all users.

Feedback from others:

Not Applicable. Peer feedback was not collected for this project, as students were advised to complete the work independently. Feedback to be provided by the tutor upon submission.

Future improvements:

There is potential scope to include saving the invoice to a file, automatically updating stock levels, and a graphical user interface could also be implemented to make the program more user-friendly.
